Hierarchical Clustering

Each (X) is a cluster

∴ In the Dendrogram, no. of possible clusters are roughly, 17 $\{(P_1, P_2), (P_3, P_4), (P_5, P_6), (P_1, P_2, P_3, P_4, P_5, P_6), (P_2, P_4, P_5, P_6), (P_1, P_2, P_3, P_4, P_5, P_6)\}$

But we find that vertical lines which is never intersected by any horizontal line.

So, Block line intercepts of 2 Pts.

so no. of clusters we can consider is "2".
